EXPERIENCE

Rippling *Staff Software Engineer* Feb 2024 – Apr 2026

- **Search.** Founding engineer and tech lead. Took Search from a product spec to GA, then to betas of Universal Search (third-party data) and AI Search (semantic and RAG), while growing the team from one engineer to six.
- Designed a new search architecture on OpenSearch that cut average query time from 3s to 100ms and grew coverage from 2 searchable data types to more than a dozen.
- Moved ingestion onto Kafka and built a general-purpose permission system that enforces Google Drive, Slack, and Atlassian access controls inside OpenSearch.
- Became the company's OpenSearch expert: tuned embedding ingestion, query caching, and k-NN memory use, and added shard-size monitoring and document-size attribution to every cluster at Rippling.
- **Data Bridge.** Embedded for two months to stabilize the internal data-sync platform: shipped readiness tracking for when data lands in each destination, async control events that decouple its components, and schema evolution.
- **Events Platform.** Built the audit-event pipeline (Kafka, Flink, Iceberg) that ingests millions of events per day. Took over an unmaintained Flink ingestion job that several teams relied on and made it resilient to most schema changes.
- Drove reliability and developer experience for the platform: interviewed six client teams to set the reliability roadmap, refactored the Go events client and added its first test suite, and halved CI time for the main Flink repo.
- Root-caused production failures across team and vendor boundaries, e.g. traced a service OOM to Datadog's MongoDB tracing library and patched it upstream, and tracked a notifications incident to an HTTP/2 bug in the shared Go stack.

Airplane *Founding Engineer* Jan 2021 – Jan 2024

- First hire at a developer platform for internal tools (acquired by Airtable). Set technical direction across the stack and helped grow the team to 22: interviewed dozens of candidates, referred two senior engineers, and mentored six.
- Proposed and led the pivot from no-code Runbooks to code-first Workflows. As tech lead, architected a durable execution runtime on Temporal that lets developers write long-running, multi-step workflows as plain TypeScript.
- Built much of the core Tasks platform: a build system that deploys code without a Dockerfile, the Docker registry, parameter schemas, environments, local development, and the first Python SDK.
- Hardened the foundations: idempotent APIs with safe retries across the Go, Python, and JS clients, Postgres tuning on the scheduling path, an embedded V8 templating runtime, and infrastructure-as-code with Pulumi.
- Led product and engineering for Runbooks, a multi-step operations builder: ran customer research, designed the UX, built the beta solo, and led two engineers to GA in six months.

Segment *Senior Software Engineer* Jul 2018 – Jan 2021

- Built much of the control plane for Hybrid Segment, which runs single-tenant pipelines in customer VPCs on Kubernetes: per-customer config replication on ctlstore (25x faster SQLite builds), provisioning APIs, and PrivateLink-based alerting.
- Designed and shipped Segment's tiered rollout system (feature gates and audit logs on ctlstore) after aligning a dozen stakeholders across engineering, product, and success. It gated launches such as CloudEvents and Demux.
- Root-caused duplicate deliveries in the RocksDB-backed dedupe pipeline, a system the org no longer had experts in: a broken metric had hidden that it retained only 38 hours of history. Extended the window to five days.
- Proposed and built a unified counters system on ClickHouse, proving out ClickHouse in production at Segment. It replaced a Redis-based system and powered Protocols violation counts, incident investigations, and pricing analysis.
- Took Typewriter, an open-source generator of type-safe analytics clients, from prototype to production across TypeScript, iOS, and Android. Shipped Protocols features that unblocked several enterprise deals.

Earlier Software engineering intern at Google (App Engine search) and Nextdoor (KPCB Engineering Fellow).

EDUCATION

University of Maryland B.S. in Computer Science, minor in Statistics. GPA 3.98, *magna cum laude*. 2014 – 2017

Graduate coursework in Computer Science: completed all M.S. course credits. 2017 – 2018

Created and taught CMSC389L, a for-credit course on cloud computing with AWS, for two semesters.

SKILLS

Languages Go, Python, TypeScript

Systems Kafka, OpenSearch, Postgres, Kubernetes, AWS, Terraform, Datadog, Iceberg, Temporal, ClickHouse, Flink, Pulumi
